GUI Customization There are also various other methods of customization and customizations available in AutoCAD and its API. Mapping, the most common example of customization, is a method by which a 3D model is mapped into 2D. Another way of customization is to edit the B-spline curves (aka Bezier curves) used to model surfaces in 3D. The B-spline curves used in this case is called a 'generalized cubic'. AutoCAD also allows the user to create custom commands, which are themselves a form of customization. Libraries AutoCAD also supports a few built-in libraries. These include: AutoLISP for executing AutoLISP functions from within AutoCAD. Visual LISP for executing Visual LISP code from within AutoCAD. This method is not limited to third-party plugins. .NET for executing .NET methods from within AutoCAD. The .NET framework includes a dynamic link library (DLL) for AutoCAD. The DLL is provided by Autodesk on their web site as well as for download through Autodesk Exchange Apps. AutoCAD also includes Java for running Java code from within AutoCAD. The java files are stored in a folder called "Script/Plugins" (Java is not supported in AutoCAD 2013, but is still available in 2016). References External

Draw freehand or use an existing drawing. Re-use existing objects or drag and drop your own objects. Create compound curves with the ribbon in the Draw & Write toolbar. Model changes are kept within the compound curve; no duplicate object history is created. (video: 1:30 min.) Instant compound curve creation is a convenient way to create curves from multiple points on a line or in a straight line. It includes a selection box and a control bar for the type of curve to use.
