The same goes for the "Camera Raw" tool as well. Such a feature would occasionally be helpful in some situations, but uses of it feel too much like the old "Adjustment Brush." In my opinion, adjusting a light color tone before opening up and using Final or better yet, Photoshop would be a better option. The "Hue/Saturation" tool on the other hand is in its place, so much that it feels weird to ask for a better one. Overall, the Photoshop version 5.0 update feels rather like an upgraded version of CS4. Any user who was happy with the previous version now has a lot to look forward to. Upon upgrading to Penultimate, I found it a great step forward and one that is sure to boost content creation even more. Of course, it is a finished product, so all we can do is take it for what it is. Looking at Photoshop with this new perspective will take some time. In any case, we are curious whether you thought this new update was constructive or, if you still prefer the previous version, why. Lightroom 5, on the other hand, is a throw-back to CS4 if that feels like a waste of words. This new version is lacking in features and comes across as a cheap imitation. However, there are some good thoughts in there. Some of the new features, such as the "fine-tune tools," "Lens Correction" tools and the new "tone adjustments" may be of use for some users. The new tools are the easiest way to get started with art-based photography and this is a better option than Photoshop, where you may dislike the existing tools. Although making use of Lightroom 5's new tools is fairly easy, I am impressed by Adobe's creativity with the image processing pipeline. The company has made a good job in hiding all those aspects which are unique to Lightroom 5. It now has a workflow, which gets something similar to CS5, but without all those new tools that we don't care about. This version adds **Basic image editing** tools and this is what we want. Admittedly, the new editing tools feel less refined, as no serious editing is supported. Still, this is our personal preference. We love editing, so any tool is better than no tool. Unfortunately, Lightroom 5 lacks all the essential ones, so we are left to use its parent frame in some instances.

There is no difference between Photoshop and Adobe Photoshop Elements. Both are built by the same company, Adobe. However, Photoshop (or Elements) will support most of the features that you will require for a professional workflow. But, Photoshop (or Elements) gives you more creative freedom and so is better suited for creative users. Probably the best tool for photo editing in general and stuff you do with photos.

Sharing and storing photos is a breeze with text along the sides and graphics and fancy animations. With so many plug-ins and extra features available, you can do just about anything with them.

### What It Does:

The Color and Swatches tool lets you use, modify, copy, and save custom colors for your content.

While this may seem like a pretty self-explanatory element, it actually has powerful features that will keep your visual content vibrant and unify your color schemes. We've mentioned the different color spaces in the previous section, but let's take a deeper dive just now. There are three main color spaces you can use: RGB/CMYK, Lab, and Wide Gamut (Gamut, to be precise). These refer to the way colors are represented:

1. Colors can be represented by a number, such as 128 (10 bits), red, green, blue, and so on, or
2. Using a related system of color names, such as red, green, blue, violet, and so on, or
3. Using a non-number look-up table where specific "primary" colors are assigned numbers, such as red, green, blue, magenta, yellow, or
